

**DAML Tools for
Intelligent Information
Annotation, Sharing
and Retrieval**

UMBC

Johns Hopkins University Applied Physics Lab

MIT Sloan School

May 2004

Our Research Agenda

- We have three themes, each lead by one team member and with participation from all
 - Semantic web & agents (UMBC)
Tim Finin, Anupam Joshi, Yun Peng
 - Semantic web & information retrieval (JHU)
Jim Mayfield
 - Semantic web & rules (MIT)
Benjamin Grosf
- Our approach is largely experimental -- building prototypes & tools rather than proving theorems

Theme #1

OWL will enable agents in open, dynamic environments (e.g., agentcities) to share knowledge and manage security, privacy, trust and commitments.

- Working in multiagent systems
- Supporting pervasive systems
- Supporting trust and security in web services

Travel Agent Game in Agentcities

Motivation

- Market dynamics
- Auction theory (TAC)

Owl for negotiation

Features

- Open Market Framework
- Auction Services

Owl for publishing communicative acts

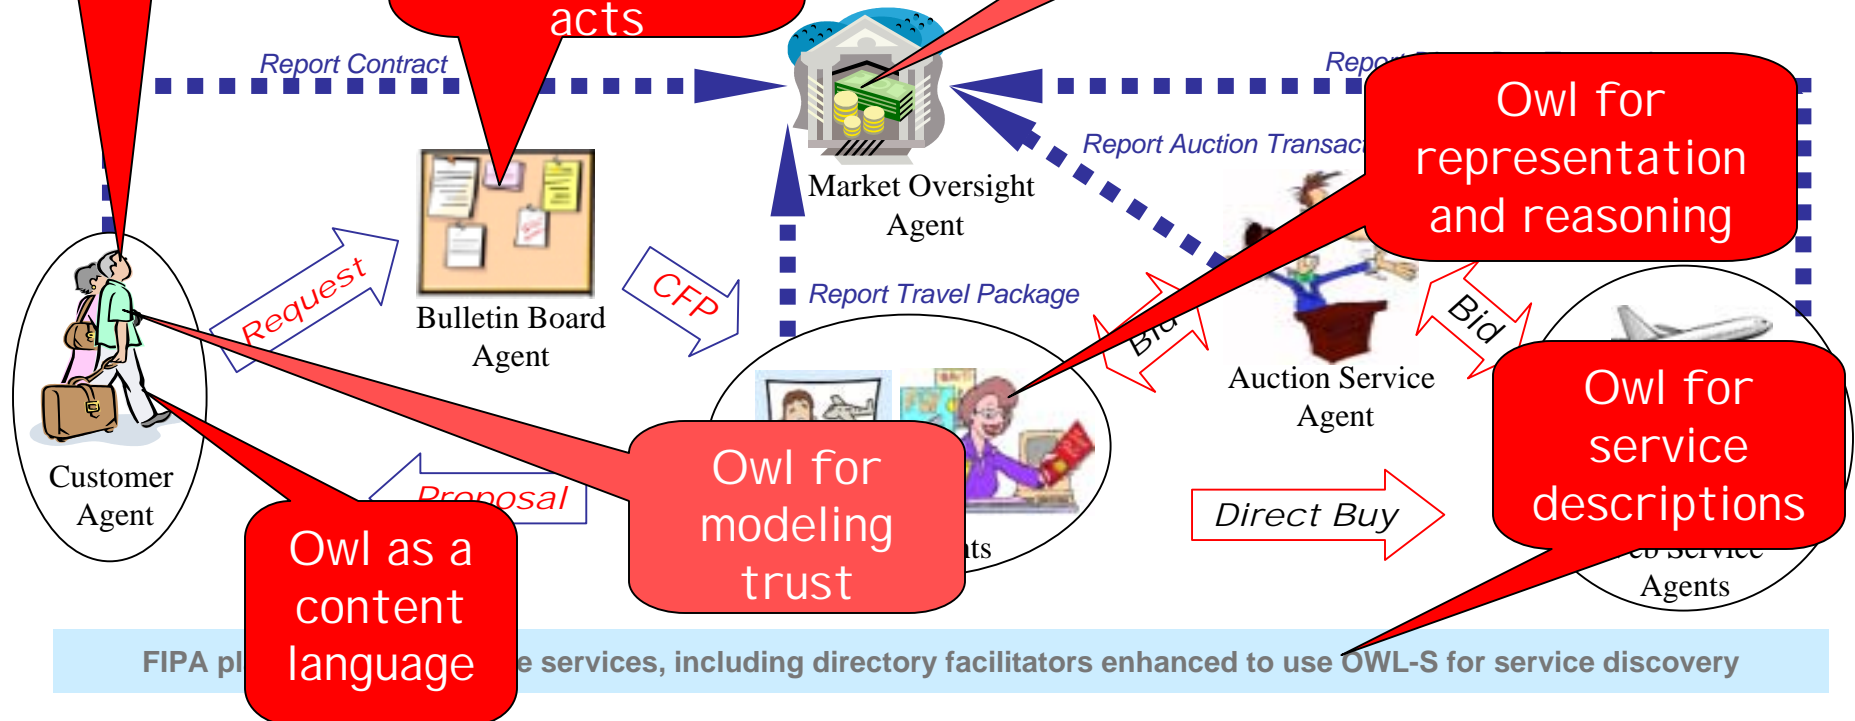

Technologies

- FIPA (JADE, Agent-Platform)
- Semantic
- Web (S)
- Internet

Owl for contract enforcement

Ontologies

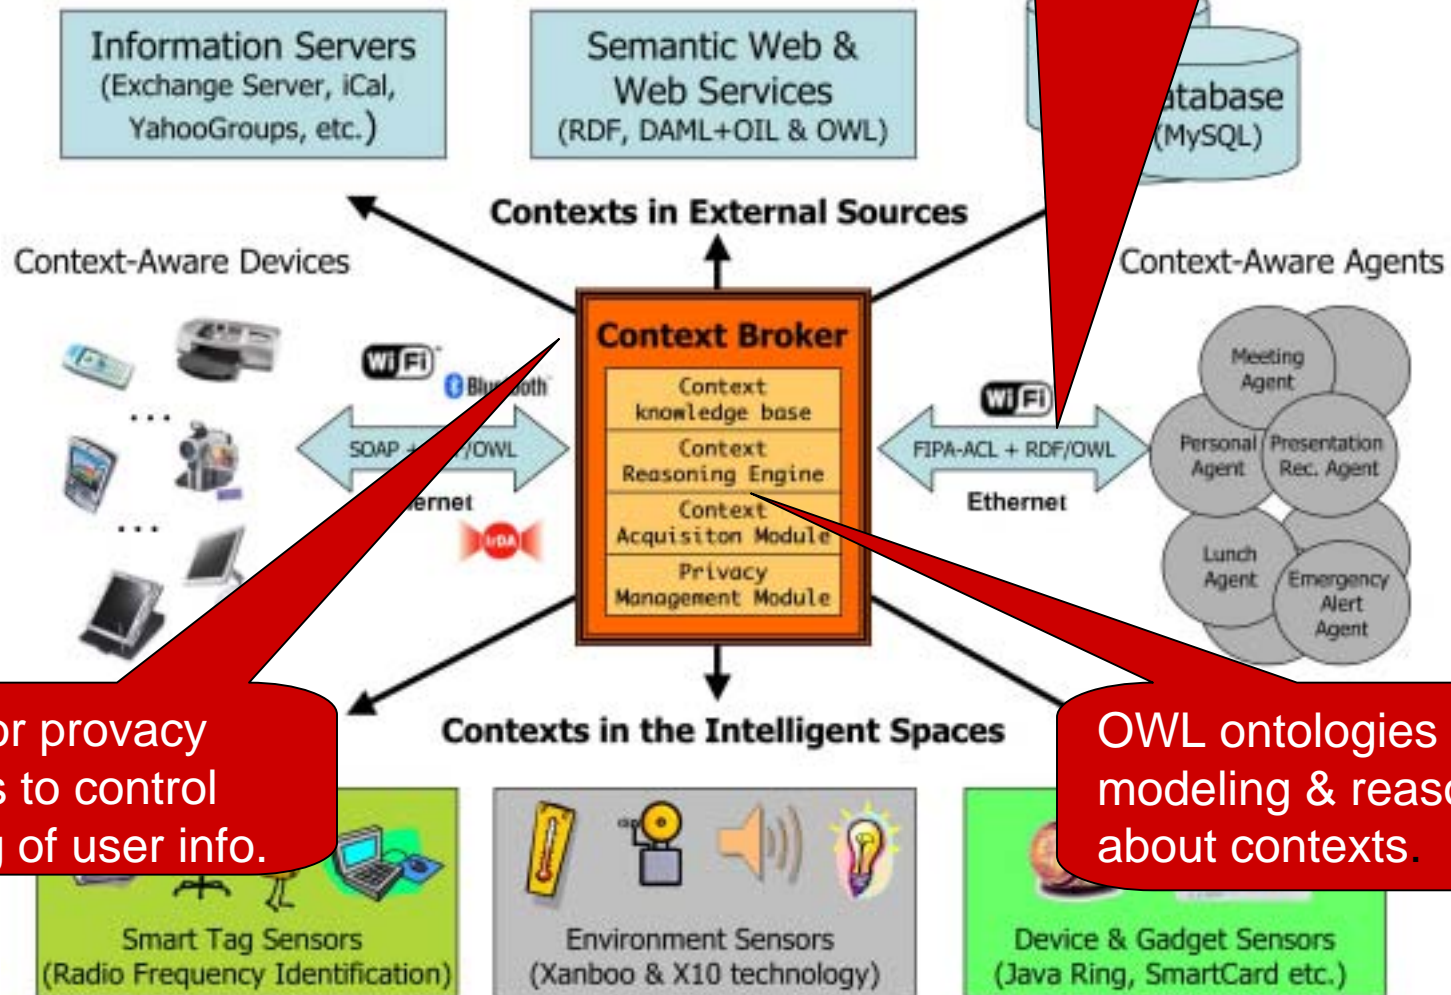

- <http://taga.umbc.edu/ontologies/>
- travel.owl - travel concepts
 - fipaowl.owl - FIPA content lang.
 - auction.owl - auction services
 - tagaql.owl - query language

<http://taga.sourceforge.net/>

OWL in Pervasive

OWL ontologies allow broker, devices, agents & services to share information.

OWL for provacy policies to control sharing of user info.

OWL ontologies for modeling & reasoning about contexts.

Rei Policy Applications: past, present & future

- Coordinating access in *supply chain management system*
- Authorization policies in a *pervasive computing environment*
- Policies for team formation, collaboration, information flow in *multi-agent systems*
- Security in *semantic web services*
- Privacy and trust on the *Internet*
- Privacy in a *pervasive computing environment*

Theme #2

OWL will be integrated with other knowledge representation paradigms for real world reasoning, e.g. rule based systems and bayesian belief networks

- F-OWL reasoner
- Bayes OWL
- OWL and rules

F-OWL Reasoner

- F-OWL is an OWL reasoner implemented in XSB's Flora-2 system.
- <http://fowl.sourceforge.net/>
- Features:
 - Supports RDF and OWL-Full
 - Supports RDF/N-Triple query
 - Supports Dynamic Import
 - Provides a Java API
 - Tested with the RDF and OWL test cases, See <http://www.w3.org/2003/08/owl-systems/test-results-out.html>

Bayes Owl

- Probabilistic extension for uncertainty in ontologies:
 - Extend OWL for probabilistic annotation
 - Translate OWL ontology to Bayesian network (OWL-BN)
 - Probabilistic mappings between individual OWL-BNs
 - ⇒ Treat ontology reasoning as Bayesian inference
- Plan for remainder of 2004
 - Complete translation rules for RDF constructors and formalize translation rules based on OWL semantics
 - Complete construction procedure for conditional probability tables
 - Complete translation algorithm, OWL \rightarrow OWL-BN
 - Preliminary investigation on probabilistic concept mapping between OWL-BNs

MIT rules work

1. How to combine rules with ontologies
2. Uses of rules for services, especially in e-commerce, e.g. for
 - E-contracts
 - Financial reporting and information
 - Trust policies
3. Analysis of business case, value, strategy, and requirements for rules and services

New MIT Research Results

- **Trust Policies in Finance using Rules**

Application scenarios; analysis of business case, value, strategy, and requirements

- **Representing Process Handbook Ontologies using Rules** – including OO-style default inheritance

Early prototype; new design improves scalability; analysis of business case, value, and strategy (e.g., to use Legacy OO process framework knowledge)

- **Refining SweetDeal E-Contracting approach** (rules+ontologies)

Concepts, paper, presentations

- **SWRL V0.5, V0.6** – co-authored; co-led Joint Committee rules effort

Adds horn rules and RuleML syntax to OWL, in tightly integrated fashion. Reports; W3C member submission.

- **RuleML V0.85** – co-authored; co-led RuleML Initiative

Adds improved syntax support for OWL, RDF, and object-oriented -- in coordination with development of SWRL

MIT Plan: next 6 months

- Continue the focus areas listed earlier
- New phase effort on tools for rules
 - New prototyping of SweetRules for RuleML/SWRL translation/interoperability, inferencing & authoring/testing
 - Support OWL, XSB, Jess, other systems
 - Pluggable architecture to integrate tools from multiple groups in and out of DAML
 - Open source on SemWebCentral

Theme #3

OWL will enable IR systems to work with documents which contain knowledge encoded in semantic markup.

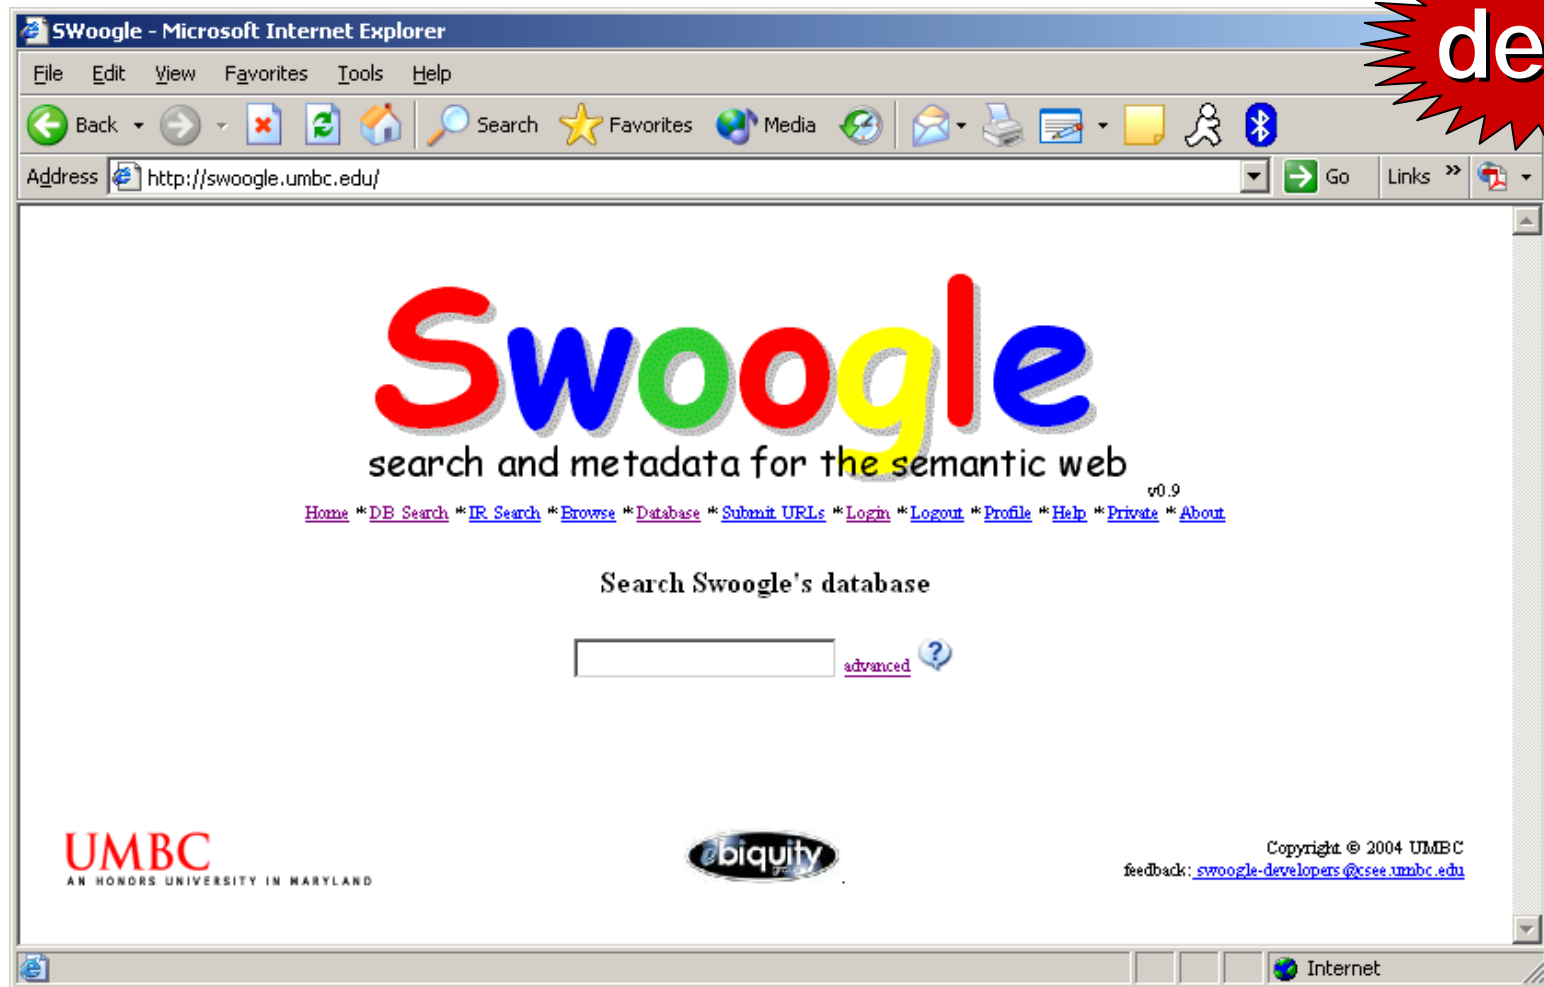

- Swoogle indexing and retrieval system for semantic web documents
- Swangling semantic web documents to prepare them for other conventional IR systems like Google.

Why use IR techniques?

- To retrieve over the structured & unstructured parts of a semantic web document
- To prepare for the appearance of text documents with embedded SW markup
- To harness web infrastructure such as Google
- To take advantage of the unique and useful properties of IR techniques
 - e.g., ranking matches, computing the similarity between two documents, relevance feedback, etc.

http://swoogle.umbc.edu/

demo

Swoogle is a crawler based search and retrieval system for semantic web documents

Harnessing Google demo

- Google started indexing RDF documents some time in late 2003
- Can we take advantage of this?
- We've developed techniques to get some structured data to be indexed by Google
- And then later retrieved
- Technique: give Google enhanced documents with additional annotations containing *Swangle Terms*™

Swangle defined

swan·gle

Pronunciation: 'swa[ng]-g&l

Function: *transitive verb*

Inflected Forms: swan·gled; swan·gling /-g(&-)li[ng]/

Etymology: Postmodern English, from C++ *mangle*,

Date: 20th century

1: to convert an RDF triple into one or more IR indexing terms

2: to process a document or query so that its content bearing markup will be indexed by an IR system

Synonym: see *tblify*

- swan·gler /-g(&-)l&r/ *noun*

Swangling

- Swangling converts a triple into seven word-like terms
 - One for each non-empty subset of the triple components with missing elements replaced by a “*don't care*” URI
 - Terms generated by a hashing function (e.g., MD5)
- Swangling an RDF document means adding triples for swangle terms.
 - Triples might be explicit ones or added by inference
 - Resulting RDF document can be indexed and retrieved via conventional search engines like Google
- Allows one to search for a semantic web document with a triple that claims “*Osama bin Laden is located at X*”

A Swangled Triple

```

```

Summary: 2004 Deliverables

- Software tools on semwebcentral.org
 - Swangling tools, F-owl, Rei, SweetDeal, BBN tools, ...
- OWL ontologies
 - For FIPA standards
 - For security and trust
 - For swangling
 - SOUPA: Standard Ontologies for Ubiquitous and Pervasive Applications
- Hosted services
 - Swoogle
- Contributions to standards
 - RuleML, SWRL, SWSI, ...
