Problem Statement

- Air Mobility Command's (AMC) Diplomatic Clearance Problem
 - Loss of over \$80K in fuel and one sortie daily due to Dip clearance violation
 - Loss of over \$100K per day during contingencies
 - Indirect Effects:
 - Lost crew time
 - Delays in transportation/supply system
 - Disrupted flight/cargo movement schedules

Automated Clearance Tool (ACT)

ACT is an agent based, decision-support tool that supports the processing of diplomatic clearances at Air Mobility Command (AMC).

By leveraging the *Semantic Web* concept, ACT software agents utilize ontologies to reason about annotated data.

Solutions offered by ACT

Air Mobility Command plans global missions at a rate greater than 300 per day, many requiring a set of diplomatic clearances. Today mission planners must manually calculate lead times, calendar constraints, and country restrictions to determine diplomatic clearance viability.

Is there HAZMAT aboard?  *What type and category is it?* 

Is there enough lead time for a clearance? 

Which countries are you flying over?

What is the cargo? 

Who is aboard? 

Is this flight part of an accepted mission?

Can a Blanket Clearance be used?

What FIR Reporting Point can be used?

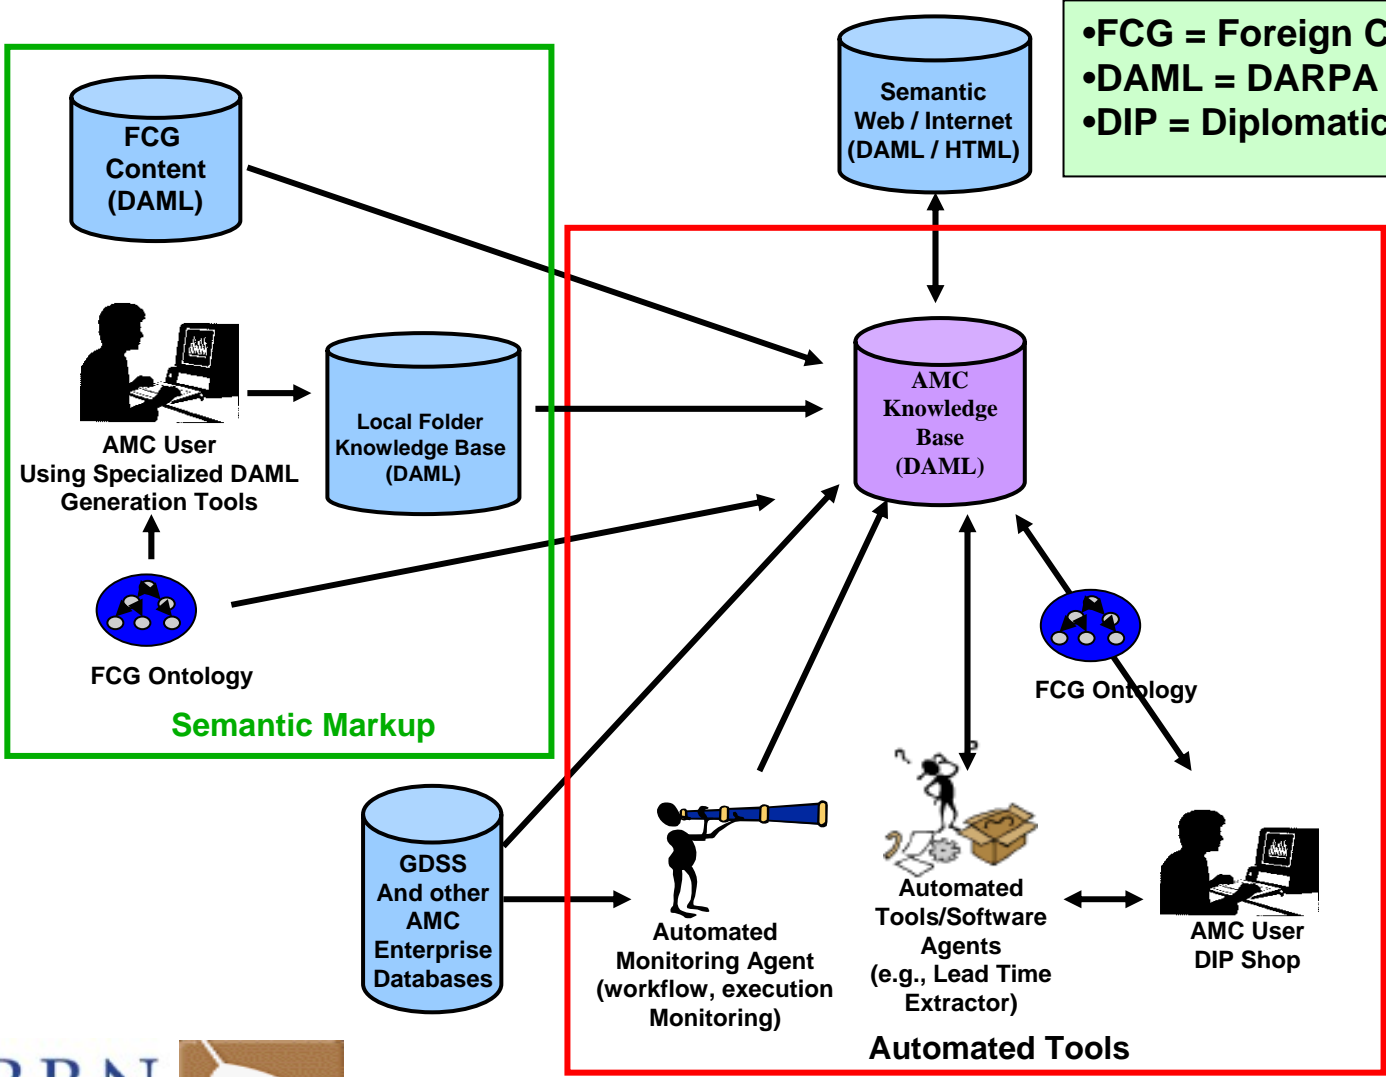

ACT automates much of this process, allowing the human planners to concentrate on the more difficult and timely problems.

FCG Automated Tool Development

- FCG = Foreign Clearance Guide
- DAML = DARPA Agent Markup Language
- DIP = Diplomatic Clearance Planner

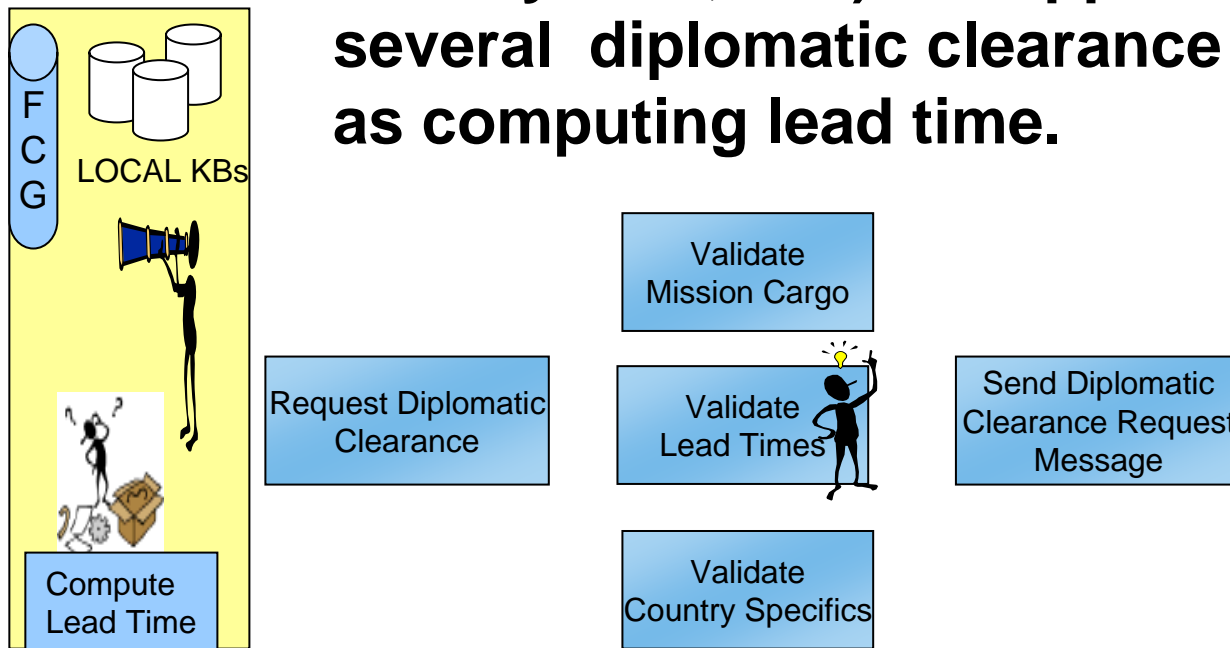

Use of Software Agent Technology

- ACT software agents will use annotated FCG country data and local knowledge bases (e.g., contact folder, working days, hazardous data, holiday data, etc.) to support and/or automate several diplomatic clearance functions such as computing lead time.

Lead Time Compute Agent

Using Act to Support Diplomatic Clearance Processing

Restriction identified by ACT software agent using rules derived from the semantically annotated FCG Country data and local knowledge bases (e.g., working days, holidays, hazardous cargo, contact folder)

Using Blanket Clearances

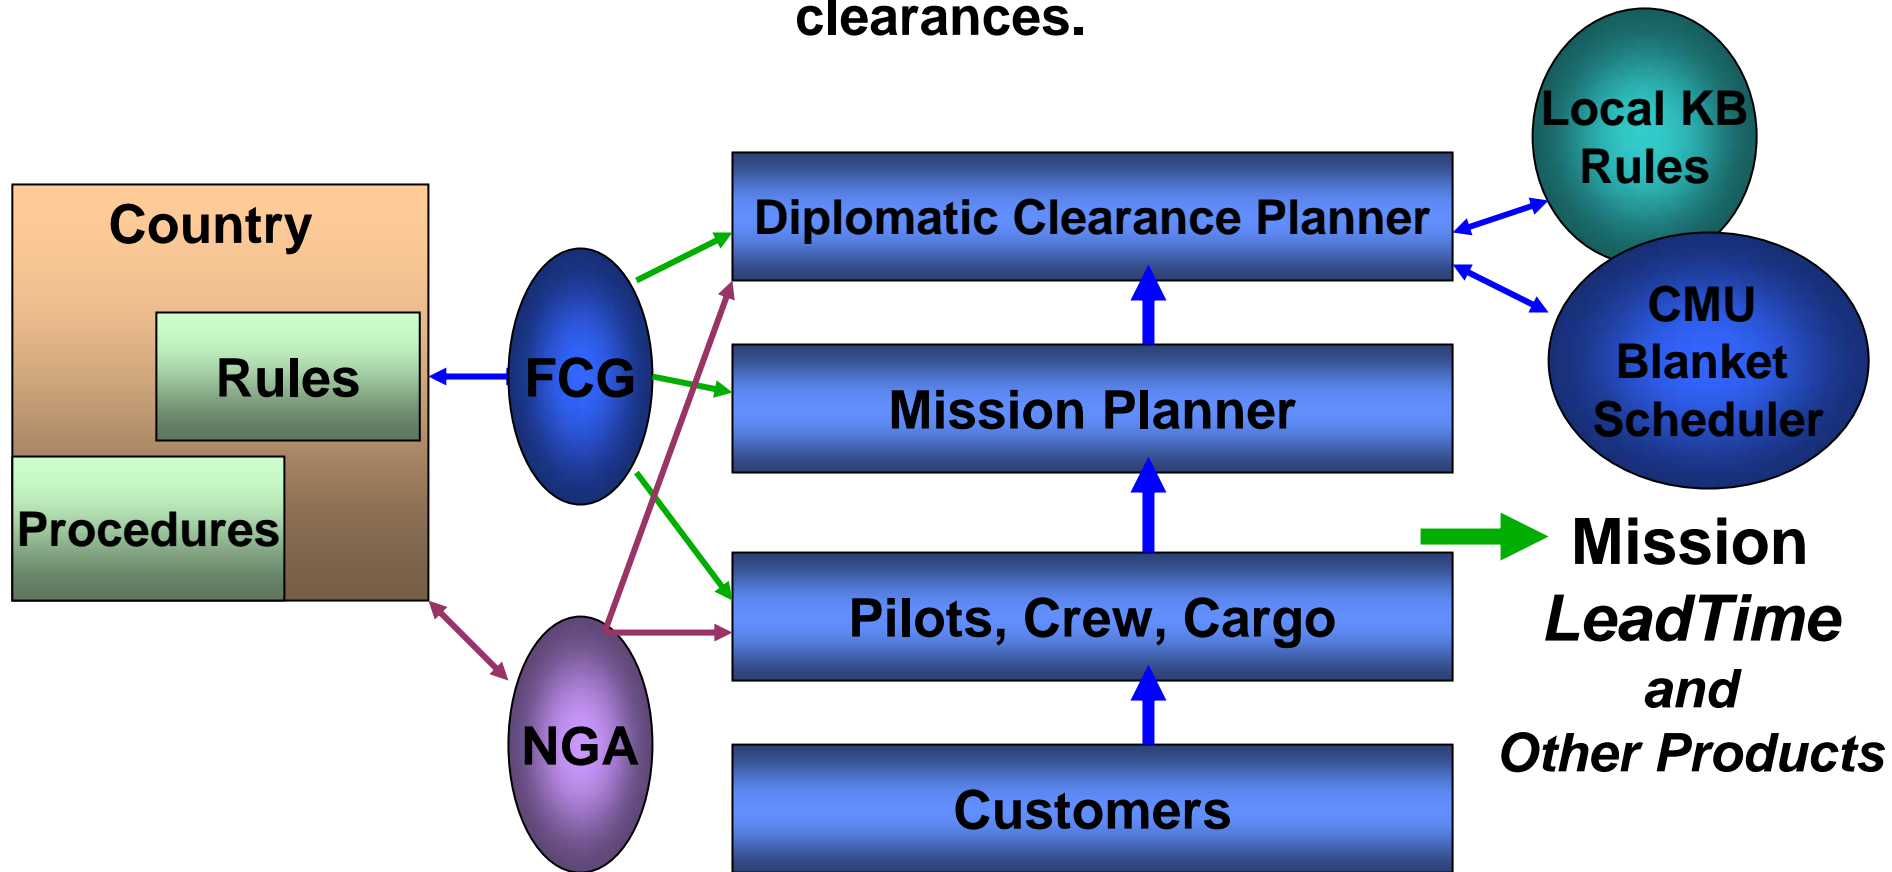

- **When a Blanket Clearance can be used for a landing or overflight, ACT automatically re-computes the lead time for the affected legs and overall mission.**
- **The CMU tool manages the assignment of blankets by checking that all of the conditions for usage of a blanket are valid before granting the blanket. The system can also detect conflicts. Future work would allow this tool to support de-confliction and re-assignment of blankets as needed. It could also support blanket management, e.g., request for new blankets when blanket clearances expire.**

Lead Time Engine that Reasons with Semantically Annotated Data

- Allow planners at different levels of the C2 structure to reason about the requirements of an AMC mission for diplomatic clearances.

The Technology Behind ACT

- **ACT uses an agent-based framework and OWL technology for:**
 - Processing diplomatic clearance mission requests
 - *Monitoring key events* in the process
 - Making *changes* to existing plans as needed
 - Making requests for *blanket allocation* and *management* easier
- **ACT uses Ontologies and Semantic Annotation to provide the following capabilities:**
 - *Data-form consistency* and update
 - *Alerts* to the user about environment changes (e.g., new missions, data changes)
 - *Graphical methods* to display mission and/or diplomatic clearance problems.
 - The Automatic generation of *explanations* of how calculations are performed.

How ACT Utilities Benefit the AMC Operator

- **Fast and accurate Lead time computation**
- **Lead time changes automatically when blankets are used**
- **Lead time recalculation when missions change**
- **CMU Blanket Scheduler can automatically allocate & de-allocate blankets when a mission changes**
- **Automatic methods for reasoning with hazardous data**
- **Methods for setting the FIR reporting point**

Improvements On Current Operations and Processes

- **Increased Automation**
 - Data Entry
 - Lead time computation
 - Constraint checking
 - Blanket Allocation/De-Allocation
 - Reasoning with Semantic Markup
- Tools that support the creation of annotated data (e.g. contact folder, holidays, working days)
- Ability to communicate in a loosely coupled fashion with other services (e.g. CMU Blanket Scheduler)
- Ability to utilize multiple annotated data sources (e.g. NGA and FCG)
